Purpose

This Recommended Practice [RP] is intended to provide guidance for any project that requires the planning, submitting for approval, and final delivery of material and/or equipment, prior to installation, in order to complete that project. This RP provides the following recommendations:

- Defines the Stages within the Procurement Process
- Recommends a Priority System to be used during the Procurement Process
- Recommends a for successful submittal & review of material/equipment submittals
- Recommends a process for handling Submittal Rejections & Resubmittals
- Recommends a processes to track the Procurement Process within the project

Many CPM schedules containing major equipment deliveries show the critical or near-critical path as including the procurement and delivery of major equipment. For this reason, it is essential that this process be defined, monitored, and managed correctly to prevent this process from delaying the project completion.

TCM Framework

TCM Framework Correlation – This Recommended Practice incorporates key planning elements defined in the TCM Framework included in the following:

- Chapter 7 – Project Control Planning
 - 7.7 – Procurement Planning
- Chapter 8 – Project Control Plan Implementation

While this Recommended Practice is written with the Construction Industry in mind, it may be adapted and used with other industries requiring a similar approval process prior to final delivery of material and/or equipment.

The Stages within the Procurement Process:

Many projects that involve the creation of a product from a completed set of plans, specifications, and/or other contract documents must present material and equipment to the project owner or their representative for approval prior to installation of the material and/or equipment within the project. In most cases, the material and/or equipment cannot be ordered, purchased, or fabricated prior to the owner's representative granting approval that the material and/or equipment conforms to the contract documents.

The Procurement Process can be broken down to the following elements:

1. The Specification Process:
 - a. Identify Need
 - b. Research & Identification of Equipment and/or Material
 - c. Specify Equipment and/or Material

- 57 i. Specify Manufacturer, Vendor, or Equivalent Information
- 58 2. The Submittal Process:
 - 59 a. Submittal Preparation & Submit for Approval
 - 60 b. Review & Approval of Submittals
 - 61 c. Re-Submittals if required
 - 62 d. Deferred Approval by the Permitting Agency
- 63 3. Ordering, Fabrication, and Obtaining Material & Equipment:
 - 64 a. Order & Confirm Approval
 - 65 b. Fabrication
 - 66 c. Factory Acceptance Testing (FAT)
- 67 4. Shipping & Delivery:
 - 68 a. Packaging
 - 69 b. Shipping (Air, Sea, Land)
 - 70 c. Storage for Future Installation
 - 71 i. Documentation of Stored Location
 - 72 d. Delivery to Project Site
- 73 5. Quality Assurance & Control:
 - 74 a. Quality Assurance & Quality Control may be required during the Fabrication, Delivery, and
 - 75 Installation phases, during and after the Procurement Process, to ensure that what was
 - 76 designed, submitted, and approved is what is being installed.
 - 77 b. Manufacturer’s representative for installation oversight, testing, commissioning, and
 - 78 training.

The Submittal Process:

81 The Submittal Process is the process where the contracted party provides detailed information to the
82 Owner or their representative (i.e. architect, engineer, construction manager, or designer) as to required
83 material and/or equipment to be installed as part of a project. Such detailed information is presented in
84 order to obtain approval that the information meets the requirements of the contract documents and
85 such approval must be obtained prior to installation of the material and/or equipment, and in most cases
86 before the material and/or equipment can be ordered, fabricated, and delivered.

87
88 The process ensures that the project is moving forward and it is the goal of tracking this process to ensure
89 that there will be no delays in the project due to late arrival of material and/or equipment when the
90 project is ready for their installation.

91
92 It is a common practice for AIA (American Institute of Architects) and other internationally approved
93 specifications to use terminology that is inconsistent with AACE definitions in RP 10S-90. It is
94 recommended that the use of requesting “Critical Submittals” first will be ambiguous and
95 counterproductive. Instead it is recommended to provide a Priority System for the submittal process that
96 will ensure that those submittals with the highest priority be given immediate attention regardless of the
97 process of review status of lower priority submittals.

98

99 While the exact method of distinguishing priorities is not significant, it is important to establish and define
100 the priorities at the beginning of the project and ensure that all members of the project team are notified
101 of these priorities. The priorities may be defined numerically (1, 2, 3, etc.), alphabetically (a, b, c...x, y, z)
102 a combination of both, or as for this purpose the priorities are defined as High, Medium, and Low.

- 103
- 104 • **High:** High Priority Submittals include procurement items with zero or little Total Float,
105 making the delivery and installation a Critical or Near-Critical Activity. Other High Priority
106 Submittals may be for procurement items needed within the early stages of the project's
107 execution (e.g. first 90 days of the Construction Phase). Additional High Priority items may
108 include procurement items with extremely long lead times for fabrication and delivery
109 that may affect the Critical Path.
- 110 • **Medium:** Medium Priority Submittals include submittals for procurement items to be
111 installed after the initial start of the project's execution, but not as late as the final
112 (finishes) stage of the project. Procurement items that have a moderate to long lead time
113 for fabrication and delivery, but are not considered to be Critical or Near-Critical activities,
114 may be designated as Medium.
- 115 • **Low:** Low Priority Submittals include procurement items with their delivery activity having
116 a high Total Float value and/or may not be required until the final stages of the project
117 (e.g. insulation, control systems, signage & identification, or window blinds) and are not
118 held up by long lead times for fabrication and delivery.

119 The assignment of procurement item's submittal priority should be identified early in the project's
120 planning phase, and are not always replicated from project to project. The assigned priority to a submittal
121 may change depending on the status of the submittal and how it may affect the project schedule. If a Low
122 or Medium submittal is delayed for one reason or another, it may be necessary to increase its priority to
123 a higher level. Priority assignments should be reviewed and adjusted as necessary depending on their
124 impact to the Project Schedule.

125

126 **Types of Submittals:**

127 The type of submittal is defined by the Contract Documents. These may include several types of submittals
128 for each Submittal Package, or just a few. Early definition and verification of the Submittal Types is
129 imperative in order to streamline the process and avoid overlooking vital submittals that may delay the
130 fabrication, delivery, and installation of a material and/or equipment in the project.

131

132 The Submittal Types can be divided into three categories:

- 133 • **Project Start:** Such submittals are required either before work begins or within the first days of
134 the project. These submittals are generally included within the General Requirements of the
135 Contract Documents, and may include, but not limited to:
 - 136 ○ Project Personnel & Qualifications
 - 137 ○ Project Plans & Schedule

- 138 ○ Safety Plan & Procedures
- 139 ○ Mobilization & Site Use Plans
- 140 ○ Environmental & Protection Plans
- 141 ○ Submittal Logs or Registers
- 142 ○ Quality Control Plan & Procedures
- 143 ● **Prior to Installation:** Such submittals must be submitted and approved by the Owner's
- 144 Representative prior to the installation of the material and/or equipment within the project itself.
- 145 In many cases, the material and/or equipment cannot be ordered or begin fabrication until the
- 146 submittals have been approved. These type of submittals may include, but are not limited to:
- 147 ○ Product Data
- 148 ○ Shop Drawings
- 149 ○ Qualifications
- 150 ○ Certificates
- 151 ○ Samples
- 152 ○ Product *Schedule* or List of Products
- 153 ○ LEED Submittals
- 154 ○ Coordination Drawings (BIM)
- 155 ○ Mock-Ups
- 156 ○ Piping & Instrumentation Drawings (P&IDs)
- 157 ○ Incremental Design Drawings
- 158 ○ 3-D Design Models
- 159 ● **After Installation:** Such submittals must be provided to the Owner as part of the Project Close-
- 160 Out procedures. These type of submittals may include, but are not limited to:
- 161 ○ Quality Assurance Reports
- 162 ○ Certificates
- 163 ○ Maintenance Manuals
- 164 ○ Training Manuals
- 165 ○ Test Results
- 166 ○ Warranties and Guaranties
- 167 ○ As-Built Records

168 **Submittal Preparation:**

169 As with all projects, there is a beginning. Each project, during the semi-controlled chaos of executing
170 contracts and subcontracts, establishing the members of the Project Team, mobilization, and start of the
171 actual work of the project; there is the requirement of preparation and submitting the Submittal Packages
172 to the Owner for approval. Failing to submit for and obtain approval of initial high priority submittals at
173 the beginning of the project can result in avoidable project delays.

174

175 High Priority submittals require preparation and submittal at the earliest opportunities. In many cases,
176 this may only require product data that is readily available from the Supplier and may be produced quickly
177 after request. These types of submittals may include:

- 178
- 179 • Concrete Mix Designs (one submittal for each mix required)
- 180 • Plumbing or Electrical piping required for underground installation
- 181 • Mechanical Unit product data

182 Other High Priority submittals may require additional time for preparation and may require multiple
183 meetings and additional information before these submittals may be ready for review. This may include:

- 184
- 185 • Structural Steel Shop Drawings
- 186 • Coordination Drawings with multiple subcontractors (BIM)
- 187 • Baseline Schedule
- 188 • Specialty Items requiring collaboration between material or equipment suppliers

189 There are times when submittals may require multiple sub-submittals as part as a whole Submittal
190 Package to be complete instead of waiting for the entire package to be complete before being submitted
191 for approval. Breaking up the Submittal Package to submit the shop drawings for steel anchor bolts and
192 embeds may be more productive than waiting until every column and beam is detailed before submitting
193 the entire package as a whole, and will allow for the fabrication when they are needed with the installation
194 of foundations and walls. The Contractor and Design Team should coordinate the intent and desires of
195 how and when submittals will be broken up, combined, submitted, and reviewed at the beginning of the
196 process.

197

198 The number of copies of each submittal is usually defined in the Contract Documents, but there should
199 be enough copies to ensure multiple copies are distributed throughout the Project Team, including the
200 Design Team, Quality Control, General Contractor, and Subcontractors, as well as a record copy at the
201 project site after the submittals have been approved. Some projects require review and approval by
202 multiple agencies simultaneously or after the design team's review, while other project may require that
203 all submittals be submitted electronically (using electronic data/drawings sent through computers via the
204 internet or network) instead of making physical paper "hard copies". The Contractor should ensure there
205 are adequate copies for all reviewers are provided at the appropriate time, in the approved format, to
206 ensure that there are no delays in the approval process.

207

208 The process of preparing and submitting technical submittals should be completed quickly to allow the
209 project team to work on completing the project. It is recommended that the preparation and submitting
210 of all submittals be completed approximately within the first 25% of the project duration (e.g. 2-year
211 project duration should have all submittals to the Owner for review within the first 6-months of the
212 project). This will ensure that there will be no procurement issues late in the project, and the Project Team
213 can concentrate on other management issues through the rest of the project.

Review & Approval of Submittals:

The review process is an essential part of the submittal process that ensures that the materials and/or equipment to be installed in the project conform to the Project Documents and to physical constraints. This process can move quickly or slowly depending on the requirements, resources, and cooperation between the members of the Project Team.

As the flow of submittals going to and from the Design Team increases, cooperation between all of the Project Teams needs to ensure they are working toward a common goal (Complete the Project) and work together in completing that goal. Communication of priorities and critical nature of submittals between all parties can contribute to a cooperative atmosphere that will assist the project team to allocate resources in a manner that best serves the overall success of the project. Adversarial contention should be avoided at all costs.

The first step in the review process includes that of the Contractor reviewing all submittals from Suppliers & Subcontractors to ensure the specification requirements have been met before forwarding them to the Design Team. This step ensures that the submittals are complete, meet the requirements, and does not waste the time of the Design Team with incorrect and/or incomplete submittals. However the review of submittals that include design and/or calculations as part technical submittals are the responsibility of the Engineer of Record and not the Contractor.

Early in the process, the Owner or Owner’s Representative should establish a formal submittal process, defining a single point of contact to receive all submittals. Received submittals should be entered into the procurement log for tracking and quality control purposes (the Procurement Log is defined later in this RP).

Once the Design Team has received the submittals; Time is of the essence and all efforts should be made to review and return each submittal as soon as possible. Processing time for the submittal review is usually defined in the project documents. The processing time limit ensures that the review of each submittal is reviewed and returned quickly, but also allows sufficient time for the reviewer. The Design Team should ensure that enough personnel are available and to quickly distribute to the appropriate team member(s) for review.

The Priority System should be observed at every step of the process with higher priority submittals reviewed and returned before those of lower priority. In some cases, depending on project conditions, it may be prudent to process high priority submittals in less time than specified in the contract documents. However, lower priority submittals should be reviewed and returned in a timely manner.

There are many types of submittals that may be reviewed in minimal time, and should be returned quickly and not wait until the contractual review time has elapsed before beginning and finishing the review. While other submittals require additional time (e.g. Shop Drawings) and require careful review by an engineer, or may require review of multiple disciplines or coordination with other trades.

258 Regardless of the type or priority of the submittal, the project team should be working toward the
259 common goal of completing the submittal process in a timely manner; in a way that will not delay the
260 fabrication and delivery of the procurement items in time to be installed without impacting the project
261 schedule. Careful steps should be made to ensure that submittals do not stack up while the processing
262 time expires without review. Regular review of the Procurement Log in the weekly coordination meeting
263 will reduce the number of unexpected delays in the procurement process.

264

265 Once the Owner’s Representative has completed their review of the submittal, it should be returned to
266 the Contractor properly coded to ensure the proper actions that will ensure the advancement in the
267 Procurement Process. These codes may include the following:

268

- 269 • Approved
- 270 • Approved As Noted
- 271 • Accepted
- 272 • No Exceptions Taken
- 273 • Make Corrections Noted
- 274 • Revise And Resubmit
- 275 • Rejected

276 **Re-Submittals:**

277 While it is hoped that submittals would be approved after their first review, there will be some that require
278 corrections and resubmittal. Such rejections should be the exception, and high numbers of re-submittals
279 required in the project may be an indication of a failure to communicate throughout the Project Team.

280

281 However, there are some submittals that the Project Team can identify as historically requiring multiple
282 resubmittals in order to obtain full approval and can plan on the additional time that may be needed
283 before the ordering and fabrication of the procurement item may begin.

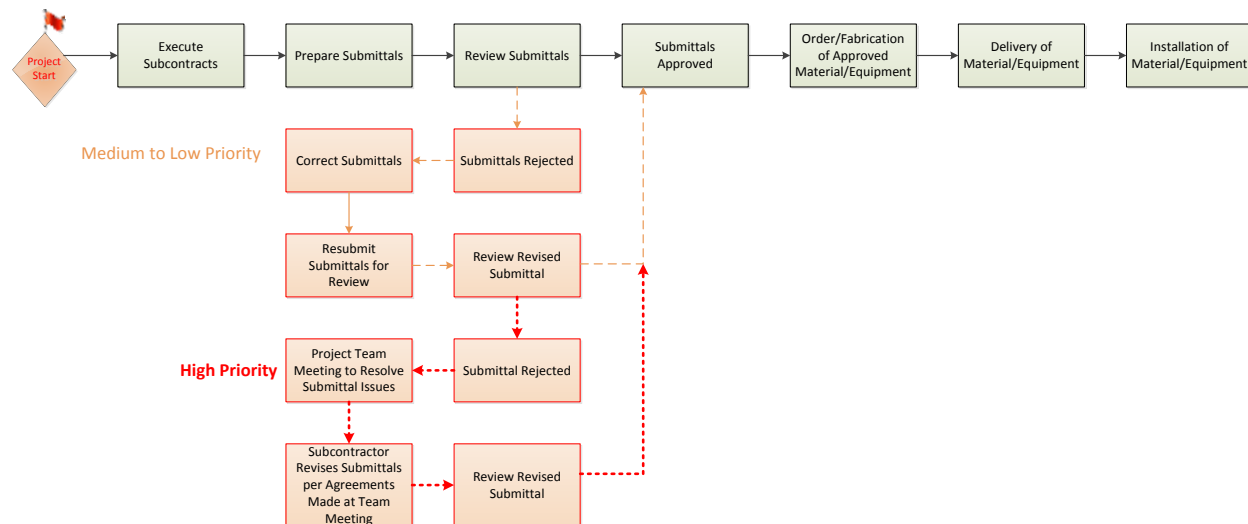

284

285 When a submittal has been coded as rejected or in need of correction and re-submittal, the entire
286 Procurement Process is halted for that particular material and/or equipment. Time is lost from the time
287 the submittal was anticipated to be approved until the Contractor can receive the rejected submittal,
288 process and forward to the Subcontractor, the Subcontractor to make corrections for re-submittal, then
289 the Contractor to receive, review, and forward the corrected submittal to the Owner’s Representative for
290 a new review, and hopefully final approval. The time lost for the rejection and resubmittal process can be
291 devastating to the project schedule and may result in a delay of the project completion by essential
292 material and/or equipment not being delivered to the project site on time for installation. Consider the
293 following flow chart:

294

March 31, 2015

295
296

297 The rejection and/or request for re-submittal of any technical submittal should be discussed in a face-to-

298 face meeting with all of the parties involved, including such parties as the Subcontractor, Supplier,

299 Detailer, and the reviewing Engineer. Such face-to-face meetings may be accomplished physically, in

300 person, or virtually, via web-conferencing or other technology. Depending on the priority of the submittal,

301 such a meeting should be scheduled immediately, or it may wait until the next regularly scheduled

302 progress meeting when most of the Project Team is already together. Multiple meetings may be necessary

303 throughout the process, and the decision to hold additional meetings should be continuously evaluated.

304

305 The first process the Project Team should consider when dealing with rejected submittals, is determining

306 whether or not the Procurement Process should be halted due to the rejection of the submittal. Normally

307 the Contractor or Subcontractor is unable to order or begin fabrication until the submittals have been

308 approved by the Owner’s Representative. However, there are times when the request for re-submittal is

309 the result of a housekeeping issue, such as incomplete calculations, and all parties may agree that the

310 designation can be changed to “Approved as Noted” and do not affect the fabrication process.

311

312 Other issues to review include:

313

- 314 • Why the submittal was rejected and what is needed for a successful re-submittal
- 315 • The project schedule; when the subject material and/or equipment is required for installation,
- 316 whether there is float, or slack, to the installation activity
- 317 • The anticipated fabrication time
- 318 • Possible back-log or demand for the same material and/or equipment from other projects before
- 319 fabrication can begin
- 320 • Escalation costs for materials involved in the fabrication process.

321 The end of this Procurement Meeting should leave all parties understanding:

- 322
- 323
- 324
- 325
- 326
- 327
- 328
- What is needed to correct and reach approval of the submittal in question
 - Who is responsible
 - When the re-submittal will be completed and ready for a new review
 - How the project schedule will be affected and what can be done to alleviate any negative impact
 - Should the priority assigned to the submittal be adjusted
 - Can fabrication begin immediately or must it wait until the submittal is corrected and approved

329 In many cases the time lost due to a rejected submittal can be alleviated by getting the parties together
330 to discuss the issues and how to get back on track. If the Engineer and the Subcontractor are in
331 disagreement over the submittal, valuable weeks can be lost, and a Low or Medium Priority submittal can
332 turn into a High Priority with the chance of negative impact to the project schedule. A little effort by the
333 Project Manager early in the process could resolve the issues before that time is lost.

334
335

336 **Deferred Approval by the Permitting Agency:**

337 A common practice in the permitting of a project by the Permitting Agency is to defer certain aspects of
338 the construction after the construction contract has been awarded. For example, “it is not efficient to
339 design elevator guide rails until after an elevator supplier has been chosen” (DSA, 2013).

340

341 In such cases, detailed performance specifications and other criteria may be deferred until after the
342 contracts are executed and in many cases after start of the project. However, the approval of the required
343 submittal information must be approved by the Permitting Agency either before the systems in question
344 are installed, or in some cases, before Certificate of Occupancy is issued.

345

346 Building systems that require Deferred Approval may include, but are not limited to:

347

- 348
- 349
- 350
- 351
- 352
- 353
- 354
- 355
- 356
- 357
- 358
- Access Floors
 - Bleachers
 - Elevators or Escalators
 - Exterior Walls Systems
 - Skylights
 - Window Wall Systems or Storefronts
 - Fire Suppression Systems
 - Stage Rigging
 - Selected Structural Components, such as
 - Stairs
 - Canopies

359 *“Note: Deferred approval does not mean that the [Architect/Engineer] A/E of Record may*
360 *refer the design of the component to the contractor. [Agency] requires that the A/E of*
361 *Record accept responsibility for verifying that all components (including those granted*
362 *deferred approval) of the project are properly designed by appropriately licensed design*
363 *professionals. The A/E of Record is also responsible for coordination of all components of*
364 *the project. Finally, the A/E of Record is responsible for designing connections to the*
365 *structure for all deferred approval components and verifying that all interactions*
366 *(deflection compatibility, drift compatibility, vertical and lateral loads, etc.) are*
367 *adequately addressed and in conformance with good engineering practices and the*
368 *[State] Building Standards Code” (DSA, et al, 2013).*

369
370 In cases with Deferred Approval submittals, it is strongly recommended that the submittals be reviewed
371 by the Owner’s Representative prior to being submitted to the Permitting Agency. Once submitted to the
372 Permitting Agency, there may be a backlog of submittals from other projects that are reviewed in order
373 of when they were submitted to the Agency. With Owner review, waiting time, Agency review,
374 resubmittals, and final approval by the Permitting Agency, it may take many weeks, months, or more to
375 obtain approval by the Permitting Agency for the deferred approval submittal.

376
377 It is essential that the Project Team plan and organize the Deferred Approval process early in the project
378 so as not to delay the project due to not obtaining proper approval by the Permitting Agency.

379
380 It is recommended that all parties involved in the Deferred Approval process meet to establish guidelines
381 and procedures that will be used in obtaining deferred approval by the Permitting Agency in a timely
382 manner. This meeting should be attended by representatives of the Contractor, Design Team, and
383 Subcontractors that are required to provide the deferred approval submittals. The Deferred Approval
384 Meeting should establish, at a minimum:

- 385
- 386 • What approvals are required by the Permitting Agency
 - 387 • Who is responsible to provide the deferred approval submittals
 - 388 • What approval is required by the Design Team prior to submitting to the Permitting Agency
 - 389 • What is the process of submitting deferred approval submittals to the Permitting Agency
 - 390 • Who is responsible for submitting the deferred approval submittals
 - 391 • Who is responsible for tracking the deferred approval process through the Permitting Agency and
 - 392 reporting to the Project Team
 - 393 • How the deferred approval submittals will affect the Project Schedule
 - 394 • What priority should be assigned to each deferred approval submittal
 - 395 • At what point will the Contractor/Subcontractor be able to begin fabrication and installation
 - 396 • How often will the Project Team meet to review the Deferred Approval process

397 The Project Team should meet regularly during the Deferred Approval process to ensure there are no
398 issues that will delay the project schedule, and the process is moving smoothly. The Project Team should

399 continue to meet until all of the Deferred Approval submittals have been approved by the Permitting
400 Agency.

401

402 **Procurement of Owner Furnished Material and/or Equipment:**

403 Many projects require coordination with the Owner on Owner Furnished Owner Installed (OFOI) or Owner
404 Furnished Contractor Installed (OFCl) materials and/or equipment with their procurement and
405 installation. Such material and/or equipment do not fall into the submittal process. Instead coordination
406 between the Owner and Contractor on when the OFOI or OFCl material and/or equipment is required for
407 installation within the normal sequence of activities within the Project Schedule.

408

409 While the Owner is required to monitor the procurement process of their own material and/or equipment,
410 it is important that the Contractor is aware of any issues related to the on-time delivery, and that the
411 Owner is notified of any changes in the Project Schedule that would affect when the material and/or
412 equipment is required for installation. Such coordination should have its own time within the regularly
413 scheduled progress meetings during the course of the project.

414

415 Activities for Owner Furnished materials should be incorporated into the Project Schedule the same as
416 Contractor furnished procurement items. While some may be tempted to insert a milestone activity and
417 assume the material and/or equipment furnished by the Owner will arrive at the appropriate time; it is
418 recommended that the schedule activities are tasks with realistic durations that are constantly tracked
419 for actual delivery and how it corresponds with the installation activities within the rest of the Project
420 Schedule. The Owner should have a representative responsible for tracking their procurement items and
421 reporting its progress the Contractor on a regular basis.

422

423 The Owner also needs to be sure all pertinent information regarding the Owner Furnished material and/or
424 equipment is provided to the Contractor that will assist in the preparation and installation of that material
425 and/or equipment when that time comes. Product Data, Shop drawings or installation drawings should
426 be made available to the Contractor for review early in the project instead of waiting until the material
427 and/or equipment is delivered. Many times this information is needed at the early stages of the project
428 for coordination, rough in, and any required subsurface preparations long before the actual installation
429 of the material and/or equipment.

430

431 The Owner should coordinate with the Contractor to be sure appropriate time is allowed within the
432 project schedule for the procurement of the Owner Furnished material and/or equipment that is directly
433 tied to the installation activity.

434

435 **Design/Build Projects**

436 Design/Build (DB) projects, sometimes referred as Engineer/Procurement/Construction (EPC) projects,
437 have a unique perspective of the Design Team and Construction Team being the same organization. In
438 these cases it is recommended that a hybrid of both practices of the normal Owner/Contractor
439 relationship and Owner Furnished Contractor Installed relationship in coordinating and tracking of the
440 procurement process. This may include formal submittals for approval, or a direct procurement of
441 designed equipment and/or material to be tracked for their desired delivery in time for installation, or a

442 combination of the two methods that will be defined by the Project Team at the planning stages of the
443 project.

444
445 In addition to the normal submittal and approval process, a Design/Build or EPC contractor may be
446 required to provide completed Contract Drawings or Engineering for various elements of the work prior
447 to beginning the submittal process for a procurement item. These time frames should be considered when
448 estimating the time of accusation, along with the actual fabrication and delivery durations of the
449 procurement items in question.

450

451 **Procurement of Material and/or Equipment from Outside Sources:**

452 There may be times within projects where an outside source will be required to provide material and/or
453 equipment that is essential to the completion of the project. One example is the procurement of the
454 electrical transformer by the Electrical Utility before permanent power is provided to the project.

455

456 The procurement of such equipment will be out of the control of both the Owner and the Contractor, but
457 needs to be carefully coordinated with the Outside Source and in the Project Schedule in order to not
458 negatively affect the Project Schedule. In many cases specific work in the field as well as specific
459 inspections are required prior to the authorization to begin the procurement process for such equipment
460 within the Outside Source's own system.

461

462 The Owner and Contractor should coordinate carefully during the planning and schedule creation to
463 ensure that all of the requirements for the Outside Source procurement process are anticipated, and
464 enough time is allotted in the schedule to allow for this sometimes uncertain process. The Owner is
465 encouraged to insert such required minimum durations into the Contract Documents to ensure their use
466 in the project schedule.

467

468 **Coordination Meetings:**

469 Throughout the procurement process, the Project Team should be meeting regularly for the Project
470 Coordination Meeting or Progress Meeting. This meeting is the time that all Project Team members review
471 and discuss all aspects of the progress of the project and all of the issues that have arisen or may arise at
472 a later date.

473

474 The submittal status should be reviewed at the regularly scheduled coordination meeting as an agenda
475 item. While this should be a minimum, both parties are encouraged to use this occasion to do more than
476 this minimum and use this time as an opportunity to review and discuss ways to mitigate future potential
477 problems in the procurement process.

478

479 The Project Team should review the Submittal Logs for potential or real problems in the submittal,
480 fabrication, or delivery process. This time can be well served by pointing out problems with submittals
481 that have not been submitted or reviewed on time, fabrication issues (including Quality Assurance/Quality
482 Control problems), or issues pertaining to the delivery and storage of the material and/or equipment once
483 fabrication is complete.

484

485 There may be times where a separate meeting required with select members of the Project Team to
486 discuss issues such as Deferred Submittals, Submittal Rejections and Re-Submittals, Owner Furnished or
487 Outside Sources procurement issues. By separating these meetings from the normal Progress Meetings,
488 non-affected Project Team members will not be required to attend, and those in attendance will be able
489 to discuss each of the issues in great detail in order to resolve the issues to keep the procurement process
490 moving forward. A Project Manager should not hesitate to call a special procurement meeting when the
491 goal is to complete the procurement process in a way that will not delay the Project Schedule.
492

493 **Tracking the Procurement Process:**

494 The procurement process should be tracked by two separate methods. The entire process will be tracked
495 with the Procurement Log, which is a detailed list of all items requiring submittal and approval prior to
496 order and fabrication, and their progress. The second method is the Procurement Schedule which is
497 included in the project CPM Schedule.
498

499 Once a project has been awarded, the Contractor should review all contract documents in detail and
500 create a list of all required procurement items and submittals. This list should also document the source
501 or sources describing submittal and acceptance requirements.
502

503 **The Procurement Log:**

504 The Procurement Log (which may also be known by many other names, such as an expediting log, or
505 procurement register, and similar to the submittal log, or submittal register) that is a detailed list of all
506 items required during the procurement process of the project, including requisition, submittals, approval,
507 fabrication, and delivery to the project site or secondary storage location. At a minimum, a Procurement
508 Log should include such information as:

- 509
- 510 • Priority
- 511 • Submittal Package Number
- 512 • Submittal Number
- 513 • Revision Number (Resubmittals)
- 514 • Description of the Submittal
- 515 • Responsible Party
- 516 • Received Date
- 517 • Sent Date
- 518 • Returned Date
- 519 • Forwarded Date
- 520 • Ordered Date
- 521 • Delivery Date
- 522 • Required Delivery Date (scheduled installation date)
- 523 • Procurement Status

March 31, 2015

- 524 • Remarks
- 525 • Copy Sent

526 The Procurement Log should be reviewed by both the Owner and Contractor on a regular basis, such as
 527 at the weekly coordination meeting. Questions about the status of submittal or procurement, along with
 528 the priority and how it affects the project schedule should be discussed on a regular basis with the Project
 529 Team.

530
 531 **Priority:**

532 The priority of the procurement item should be listed first in order for all of the project team to know
 533 without having to search the log to find out what priority has been assigned. If the status of the submittal
 534 or procurement changes due to conditions, the new priority will show up on the weekly report for review
 535 at the regular status meeting.

536
 537 **Submittal Package Number:**

538 The Submittal Package Number contains the group of submittals required by a single specification section
 539 within the Procurement Log. Each package would include all of the submittals required within each
 540 specification section.

541
 542 It is best if the Submittal Package Number follows the Construction Specification Institute (CSI)
 543 specification number contained in the Project Documents or similar control number that is known to the
 544 entire Project Team. This will allow Project Team members, as well as outside participants reviewing the
 545 project after completion, immediate recognition to what portion of work the submittal pertains, as well
 546 making searches easier to find the submittals in question.

547
 548 **Submittal Number:**

549 The Submittal Number is an extension to the Submittal Package Number. Adding an alpha/numerical
 550 extension to the end of the Submittal Package Number provides a breakdown of the submittals within
 551 each package. As an example:

| Submittal Package # | Submittal # | Description |
|---------------------|-------------|--|
| 051200 | 01 or A | Structural Steel Product Data |
| 051200 | 02 or B | Structural Steel Anchor Bolts Shop Drawings |
| 051200 | 03 or C | Structural Steel Beams & Columns Shop Drawings |

552
 553
 554 **Revision Number:**

555 The Revision Numbers is yet another extension to the already established Submittal Package and
 556 Submittal (or sub-submittal) Number. Revisions can be numbered using Zero, One, or alphabetically with
 557 A as the original submittal, and using succeeding numbers or letters for each revision or re-submittal.
 558 While the method is not germane, consistency throughout the project is important. As an example:

559

March 31, 2015

560
561
562

| Submittal Package # | Submittal # | Revision | Description |
|---------------------|-------------|----------|--|
| 051200 | 01 or A | 0 or A | Structural Steel Product Data |
| 051200 | 01 or A | 1 or B | Structural Steel Product Data Revision 1 |

563
564
565
566
567
568
569
570

Description of Submittal:

The Description of the Submittal is the type of submittal required by the Project Documents. A separate submittal (or series of sub-submittals) will be for each type of submittal required by the Contract. This allows for portions of the Submittal Package to be submitted, reviewed, and if required, re-submitted without affecting the status of other portions of the Submittal Package. Where submittals are being broken down by location within the project, that location should be identified within the Description.

571

Responsible Party:

The Responsible Party is the Contractor, Subcontractor, Supplier, or Owner that is ultimately responsible for providing the material and/or equipment that is being submitted for approval, and will ultimately provide the final product for installation within the project.

572

573

574

575

576

Received Date:

The Received Date is the date that the submittal was received by the Contractor from the Responsible Party. At this point, the Contractor will provide a review of the submittal to ensure the submittal is following the Contract Documents, as well as being complete and ready to be forwarded to the Design Team or Owner's Representative for review.

577

578

579

580

581

582

Sent Date:

The Sent Date is the date that the Contractor forwards the submittal to the Design Team or Owner's Representative for review. This is also the date used that begins the contractual review time that should be specified in the Contract Documents.

583

584

585

586

587

Returned Date:

The Returned Date is the date when the Design Team or Owner's Representative returns the submittal to the Contractor for further action. This action may be to authorize the Subcontractor or Supplier to either proceed with order and fabrication, or revisions if required.

588

589

590

591

592

593

594

595

596

597

It is important that all parties are in agreement with both of these dates since many times submittals are sent out near the end of the business day as well as at the end of the business week. What the sending party may record the date as Friday at 3:00 pm, the receiving party may record Monday at 8:00 am (a difference of 3 days). It is important that all of the Project Team review each other's logs and work out any inconsistencies in recorded dates instead of trying to make sense of conflicting dates during a claim after the project is complete. While a majority of submittals will not have any issues, it will be the few

598 submittals that do have issues that will require clarity in dates to eliminate additional issues pertaining to
599 fighting over what date something was sent or received.

600

601 **Forwarded Date:**

602 The Forwarded Date is the date that the returned submittal is sent to the Responsible Party
603 (Subcontractor or Supplier) for further action.

604

605 **Ordered Date:**

606 The Ordered Date is the date that the material and/or equipment can be ordered and fabrication can
607 begin.

608

609 While many times the Ordered Date can start immediately after the submittal is approved, there may be
610 a period of time between the time the submittal is approved and when the material and/or equipment is
611 needed at the project site for installation.

612

613 For these instances, it will be necessary to provide a future date for Ordered Date and continually monitor
614 the Procurement Log for Order Dates in the future to ensure the order of the material and/or equipment
615 is placed at the appropriate time.

616

617 **Delivery Date:**

618 The Delivery Date is either the current anticipated date of delivery or the actual date the material and/or
619 equipment is delivered to the project site. For further clarification, a designation such as F (Forecasted)
620 and A (Actual) may be added to distinguish between anticipated and actual dates.

621

622 Early in the fabrication period the anticipated delivery date may be the expected lead time used while
623 building the schedule, before the project began (e.g. the Supplier anticipated 8 weeks after approval,
624 therefore the anticipated delivery date is 8 weeks after the Order Date)

625

626 However, during the fabrication period it is recommended that the Responsible Party continually check
627 to ensure the progress of fabrication and provide an updated delivery date, which needs to be reported
628 to the Project Team who will then be able to see if there are any issues with the schedule and when the
629 material and/or equipment is required to be installed.

630

631 **Required Delivery Date:**

632 The Required Delivery Date is the current scheduled date that the procurement item is needed to be
633 delivered to the project for installation without affecting the current schedule or critical path. By having
634 the Required Delivery Date available in the Procurement Log, the Project Team will be able to see if there
635 are any difficulties in making the required date without having to constantly referring to the project
636 schedule. This date should be monitored throughout the procurement process to ensure that there is not
637 a drastic change in the project schedule; either earlier or later, depending on the pace of the project. It is
638 not recommended to rely only on the Baseline Schedule dates, but should have a constant review to know
639 if the final delivery would affect the items installation within the project or be affected by outside
640 influences during fabrication, shipping or delivery.

641

642 **Procurement Status:**

643 The Procurement Status is the status of the procurement item, whether through the submittal process,
644 order, fabrication, or delivery to the project site or off-site storage awaiting final delivery prior to
645 installation. The different statuses may include:

646

647 • Preparation

648 • Waiting Request for Information (RFI) Response

649 • Under Review

650 • Requested Additional Information

651 • Approved or

652 ○ Approved As Noted

653 ○ Accepted

654 ○ No Exceptions Taken

655 ○ Make Corrections Noted

656 ○ Revise And Resubmit

657 ○ Rejected

658 • Ordered

659 • Received by Vendor for Fabrication

660 • In Fabrication

661 • Factory Acceptance Tests (FAT)

662 • Shipped

663 ○ Travel Status

664 • Delivered Off-Site

665 ○ Location Stored

666 • Delivered On-Site

667 • Installed

668 • Site Acceptance Tests (SAT)

669 The Project Team may wish to separate the status of the Submittal Process from the Order, Fabrication,
670 and Delivery status. However, it is imperative that the Order, Fabrication, and Delivery portions are
671 continually monitored in order to ensure there are no final issues during the last legs of the procurement
672 process. If the Project Team wishes to separate the Submittal Process from Order, Fabrication, and
673 Delivery, it is recommended that an additional “Submittal Status” field within the Procurement Log be
674 added for the Submittal Process.

675

676 **Remarks:**

677 The Remarks or Comments field in the Procurement Log provides a space to add a short summary of
678 actions or issues pertaining to the current status of the particular submittal or procurement process. Such
679 issues may include:

- 680
- 681 • Date of Procurement Meeting scheduled after a Submittal Rejection
- 682 • Anticipated date of re-submittal
- 683 • Quality Control issues that came up during fabrication
- 684 • Difficulties during shipping (such as a Truckers Strike)
- 685 • Shipping Tracking Confirmation Number

686 **Copy Sent:**

687 The Copy Sent or CC field in the Procurement Log will allow the documenting of the parties within the
688 Project Team that received final copies of the approved submittals for reference during their portion of
689 work in the project. This field may be filled out early, based upon information gathered in coordination
690 meetings as to which parties need certain information when it is available. A check mark, or “X” box may
691 be added later to signify that the copy was actually sent.

692

693 Procurement Logs are available, or may be modified from existing logs in several project management
694 software programs currently available on the open market, as well as creating a new log using any
695 database, spreadsheet, or word processor software. The use of database software will increase the ability
696 to sort, filter, and create customized reports.

697

698 The final make-up of the Procurement Log will depend on company practices or Owner requirements.
699 Regardless of the programs used or the final look of the Procurement Log, the goal is to provide a detailed
700 record of the Procurement Process, including the Submittals, Order, Fabrication, and Delivery to the
701 project site for installation. The Procurement Log needs to be updated regularly and accurately. The
702 Procurement Log should be reviewed at each Project Coordination or Progress Meeting, with constant
703 review of any issues that currently impact or may have a future impact on the Project Schedule.

704
705

706 **Critical Path Method (CPM) Procurement Schedule:**

707 The procurement process for major pieces of material and/or equipment should be modeled in the project
708 schedule. This practice allows for a better understanding of where each activity fits into the entire
709 construction schedule and evaluates how critical each piece of work is through the analysis of computed
710 total float. A CPM schedule containing properly defined procurement activities will also allow for quick
711 analysis of anticipated or actual delays, assisting in possible recovery planning.

712

713 The Procurement Schedule is as a subset within the Project CPM Schedule for the purpose of tracking the
714 procurement process as it relates to the quick approval, fabrication, and delivery of essential items prior
715 to the installation in the field. These items are not as detailed as in the procurement log, but are grouped
716 together to provide a summary view of the process and if there are any delays in procurement in relation
717 to the physical installation in the field. Each grouped item would include all submittals within the Submittal

718 Package that are required for approval before order and fabrication can begin. There are usually four
 719 distinct schedule activities for each group of submittals that are then tied to the installation activity within
 720 the project schedule.

721

722

723

724 It is the goal of the Procurement CPM Schedule to provide easily referenced activities that will track the
 725 material and/or equipment for the project from the submittal to fabrication to delivery and how it will
 726 affect the installation within the project. Ideally, the CPM schedule and the Procurement Log should be
 727 linked dynamically if possible, so that changes to the schedule will be updated in the log and/or vice versa.
 728 However, such a link is not possible without advanced project management software and may be required
 729 to be performed manually.

730

731 It is recommended that procurement schedule include at a minimum only those procurement items that
 732 may affect the critical path, or project completion, and leave the remaining items to be tracked through
 733 the Procurement Log.

734

735 However there are some projects that require a higher level of detail included in the CPM schedule. In
 736 those cases it is recommended that the maximum to be included in the CPM schedule to have activities
 737 grouped within the Submittal Package, unless specific material and/or equipment within the same
 738 Submittal Package require additional tracking. If more information is required, the Procurement Log is
 739 available that will have detailed information on each individual submittal item within the submittal
 740 package that will include information such as delays in original submittals, rejections and resubmittals,
 741 changes in scope, or other delays in the process.

742

743 By grouping submittals packages, the amount of schedule activities within the procurement phase of the
 744 CPM Schedule is reduced to a controllable number. Limiting the number of procurement activities within
 745 a schedule may be essential to keep from befuddling the entire project schedule. An example:

746

747

748

749

750

751

752

- The order of magnitude of the project is \$5,000,000
- Within this \$5 million project there are approximately 500 work activities
- There are between 16-23 CSI Divisions
- Each Division may have 12 Sections of individual material and/or equipment requiring procurement
- Each Section may require between 4-12 submittals for an individual material and/or equipment

March 31, 2015

- 753 • There are 4 schedule activities for each procurement item (Prepare, Review & Approve, Order &
754 Fabrication, Delivery to Project).
- 755 • There can easily be 1,500 to 2,000 procurement activities in the project schedule that has 500
756 work activities.
- 757 • This makes the procurement activities out numbering the work activities by 3:1 or 4:1

758 The Procurement Log already provides detailed information on each procurement item with all of the
759 appropriate dates. By duplicating all of this information within the CPM Schedule, the schedule then
760 becomes more of a record keeping device instead of the project tool that it should be to enable the
761 Contractor to build the Project and the Owner to monitor the Project’s progress. Another item to consider
762 when limiting the number of procurement activities in the schedule is the time required to maintain the
763 schedule with actual dates that are already accounted for within the Procurement Log.

764
765 By grouping the procurement activities within the Submittal Package, the number of activities within CPM
766 Schedule is reduced to the 4 activities (Prepare, Review & Approve, Order & Fabrication, and Delivery to
767 Project) for each procurement item. This will reduce the ratio between work and procurement activities
768 to a manageable number and reduce maintenance time.

769
770 There may be instances where more detailed tracking of procurement items is desired; such as Structural
771 Steel for individual buildings, or different types of Kitchen Equipment (Kitchen Hood & Walk-In Coolers)
772 that may be essential to the interior construction. The Project Team should agree to the amount of detail
773 and any exceptions for procurement activities within the CPM Schedule during the planning of the project.

774
775 When building the CPM Schedule and adding procurement activities, there are ways that allow easy
776 reference to the Procurement Log for each procurement items within the project schedule. While there
777 are some scheduling software available that do not automatically provide the fields for these practices,
778 there may be custom fields available that will allow similar functions within the software.

779
780 **Activity ID:**

781 The practice of creating “Smart Activity IDs” is common, and their use allows a user to know much about
782 the schedule activity by its ID number alone. Using the CSI Specification number for the items in the
783 Activity ID will allow users to immediately know what material and/or equipment the schedule activities
784 to which they pertain. Adding a suffix to the CSI number may be used to separate the type of procurement
785 activity (Prepare, Review & Approve, Order & Fabrication, Delivery to Project) as indicated below:

| Activity ID | Description |
|-------------|--|
| 07320-10 | Prepare Roof Tiles Submittals |
| 07320-20 | Review & Approve Roof Tiles Submittals |
| 07320-30 | Order & Fabrication Roof Tiles |
| 07320-40 | Delivery Roof Tiles |

787
788 **Activity Codes:**

789 The use of Activity Codes allow for easy grouping, sorting, and arranging similar activities when preparing
790 reports. Including specific Activity Codes for the procurement process will increase the efficiency when
791 preparing procurement reports and how they affect the CPM Schedule. Such Activity Codes may include:
792

- 793 • Type of Activity
 - 794 ○ Procurement
 - 795 ○ Mobilization
 - 796 ○ Construction
 - 797 ○ Systems or Mechanically Complete
 - 798 ○ Startup & Commissioning
 - 799 ○ Close Out
- 800 • Phase
 - 801 ○ Prepare Submittals
 - 802 ○ Review & Approval Submittals
 - 803 ○ Order & Fabrication of Material/Equipment
 - 804 ○ Delivery to Project
 - 805 ○ Deferred Submittal
- 806 • Priority
 - 807 ○ High Priority Submittals
 - 808 ○ Medium Priority Submittals
 - 809 ○ Low Priority Submittals
- 810 • CSI Specification Numbers
- 811 • Responsibility

812 While the above examples of Activity Codes mostly deal with the Procurement Process, the use of activity
813 codes for all phases of the project is encouraged and should be agreed within the Project Team during the
814 planning process.
815

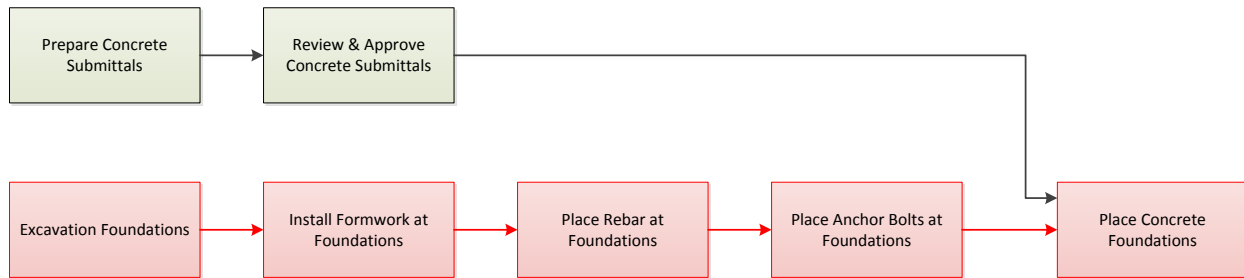

816 **Logic Ties & Restraints:**

817 As in normal CPM practices, each schedule activity should have a predecessor and successor. Procurement
818 and submittal activities should be tied to their logical predecessors and successors from the start of the
819 project until the material and/or equipment is installed in the project. As an example:
820

821 Concrete mix designs are usually a readily available data sheet for each concrete mix to be used in the
822 project. The process will be to prepare the submittal then the Engineer will review and approve or return
823 the submittal. The submittal is required to be approved prior to placing concrete on the project, and there
824 is not a fabrication or delivery activity needed. Thus the successor to approval of the Concrete Mix Design
825 should be the first concrete placement on the project, as indicated below:
826

March 31, 2015

827
828

829 Other procurement items may require fabrication, lead times, and extensive shipping before being
830 delivered and available for installation. While many items have a limited number of procurement
831 activities, additional activities may be desired depending on the time requirements, and should be agreed
832 upon by the Project Team.

833

834 Consider the requirement of using specific materials from another country. The material (in this case
835 Italian Granite for countertops) is provided only by a single supplier, who estimates a 6-week lead time
836 after approval for providing the slabs of granite to be shipped. Shipping from Italy to North Dakota (USA)
837 is estimated at 3-weeks. The time between obtaining approval of the submittals until the time the
838 subcontractor can begin fabrication is 9-weeks, assuming there are no problem getting the material
839 through customs. In this case, the Project Team agrees that the entire process should be scheduled within
840 the Project Schedule and this particular material will be carefully tracked, as indicated below:

841

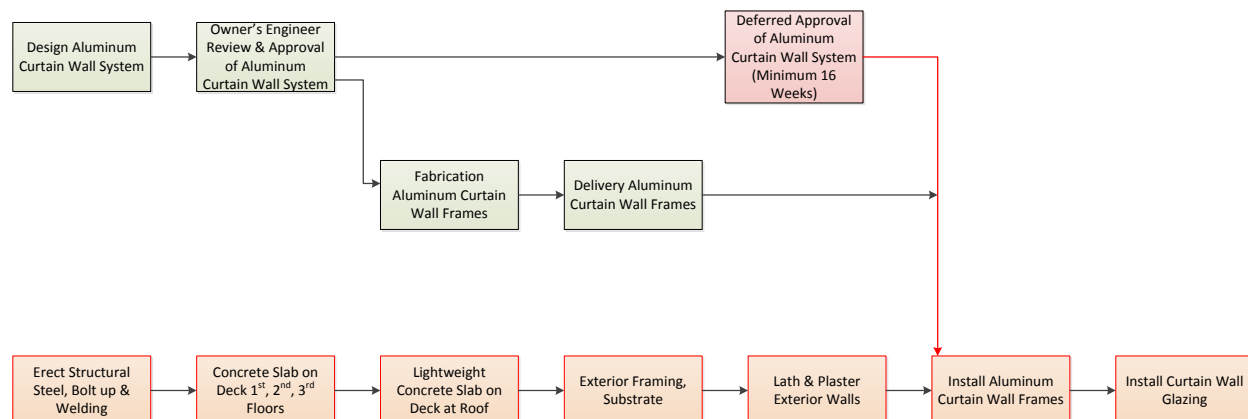

842
843

844 Another exception in the process is the Deferred Approval. This requires that the Subcontractor design
845 the system by a licensed engineer (in this case an Aluminum Curtain Wall System) that will be reviewed
846 by the Owner’s Engineer, and then sent to the Permitting Agency for their review and approval. It has
847 been decided by the Project Team that the Deferred Approval must be obtained before installation, but
848 the Subcontractor may take the risk of fabrication before final approval has been given.

880

Cost Loading:

Many contracts allow the billing for large material and/or equipment purchases once the items have been delivered to the project site, or an agreed upon off-site location. For these instances, it is acceptable to cost load the "Delivery" activity in the Procurement Schedule which will indicate when the Contractor anticipates delivery and payment for each particular procurement item.

There are also costs associated with the preparation of submittals, such as shop drawings requiring a detailer or engineering costs in deferred submittals. Many contracts do not allow for cost loading or billing for such submittal preparation activities, and expect these costs to be rolled up in either delivery or installation activities. However, the method of planning for these costs should be agreed within the Project Team at the beginning of the project in order to not delay the submittal and approval of the Baseline Schedule over inappropriate cost loading for procurement activities.

Timing of Deliveries:

Except for materials and equipment required at the beginning of the project, many procurement items will be scheduled for fabrication and delivery sooner than realistically expected. While it is recommended to have all procurement submittals approved early in the project, there is nothing keeping the successor activity of Order & Fabrication from starting immediately after the approval by the Owner. In addition to these activities remaining without actual dates during schedule maintenance and repeatedly showing up as activities without progress, the project cost forecasts and Earned Value will be inaccurate.

While there may be instances where material and/or equipment may be delivered earlier than the date of installation, there are many factors that the Project Team should consider, including cost effectiveness, location of storage, loss or damage, possible shipment delays, and possible ease of access issues prohibiting delivery after surrounding work is completed. These exceptions should be considered by the Project Team when early delivery is requested.

Just-in-Time Deliveries:

881 Using a Just-in-Time system for deliveries will ensure more accurate estimations on material and/or
882 equipment deliveries as well as Cost Projections and Earned Value analysis during the schedule
883 maintenance. In order to ensure Just-in-Time delivery in the CPM Schedule, the scheduler may:

- 884
- 885 • Create a lag time between the predecessor and successor activities giving a “best guess” when
886 Order & Fabrication and Delivery to the Project Site will happen.
- 887 • Create logic relationships or restraints between the Order & Fabrication activity and an actual
888 work activity in the project that will trigger the Order & Fabrication activity and delivery
889 happening near the time the material and/or equipment is needed within the project. (e.g. Start
890 the Order of Metal Studs and Drywall activity after the Structural Steel has been installed)
- 891 • Some of the newer scheduling software allows assigning an “As Late As Possible” constraint to
892 the activity that will use all of the Free Float to the Order & Fabrication and Delivery activities
893 before starting.

894 Whatever the method used to create the Just-in-Time delivery activities within the CPM Schedule, it
895 should be agreed within the Project Team and used consistently throughout the project schedule.

896

897 **Maintenance of the CPM Procurement Schedule:**

898 As with the Project CPM Schedule, the Procurement Schedule requires constant maintenance throughout
899 the Procurement Process in order to accurately forecast delivery dates and alert the Project Team for any
900 problems that may affect the Project Schedule.

901

902 **Prepare Submittal Activities:**

903 The start date for the Prepare activities is the date that the Responsible Party was directed to provide
904 their submittals. The Finish date is when the submittals have been submitted to the Owner for review.
905 While the start date for these activities is more important during the forecasting of the succeeding
906 activities, it is the Finish date that is important to track during schedule maintenance.

907

908 **Review & Approve Activities:**

909 The start and finish dates for the Review activities are as recorded in the Procurement Log. For multiple
910 submittals within the Submittal Package that were grouped together for the CPM Procurement Schedule;
911 the Start date is when the first submittal was submitted and the Finish date is when the last submittal was
912 approved that enabled the Responsible Party to order and begin fabrication of the material and/or
913 equipment within that Submittal Package.

914

915 **Order and Fabrication Activities:**

916 The Order & Fabrication dates are also as recorded in the Procurement Log. The activity Start is when the
917 Responsible Party was given authorization to proceed with manufacture or fabrication of the material
918 and/or equipment within that Submittal Package.

919

920 The Finish date is noted as when the material and/or equipment is ready to be delivered to the project
921 site. If there is normal shipping time for the delivery, it may be included within the Order & Fabrication
922 activity. However, there may be times that special shipping needs require an additional activity as stated
923 earlier.

924

925 **Delivery Activities:**

926 The delivery activities are usually a single day activity to record when the material and/or equipment have
927 been delivered to the project site. This is usually to mark the date the Subcontractor or Supplier are able
928 to bill for the material and/or equipment delivered, but will also indicate the completion of the
929 Procurement Process for that Submittal Package item.

930

931 The Start and Finish dates recorded for delivery should be the dates the delivery actually happens with
932 recorded delivery slips to back it up.

933

934 It is essential that all Actual Start and Finish dates within the Procurement Schedule are as accurate as
935 possible to avoid any credibility issues in the future. Forecasting actual delivery dates for payment within
936 an earlier period than reality should be avoided.

937

938 **Recommended Practices**

939 1. Procurement items should be prioritized for the Submittal Process depending on when it is
940 required how long it takes to be delivered after the Submittal has been approved, and the
941 scheduled total float.

942 2. The Submittal Process should be completed approximately within the first 25% of the project's
943 duration (e.g. a 2 year project should have all submittals complete within the first 6 months)

944 3. The Project Team should work together in completing the Submittal Process as early as possible
945 to ensure materials and equipment are ordered and delivered so as to not impact the project.
946 While it may be the responsibility for the Contractor to submit and the Owner to review; the
947 entire Project Team has the responsibility to complete the project together.

948 4. Rejected Submittals should trigger a Procurement Meeting that will get all of the parties involved
949 in finding resolution to the rejected submittal and keep the procurement process moving.

950 5. Deferred Approval submittals should be planned early in the project to ensure approval from the
951 permitting agency as quickly as possible.

952 6. Procurement process for Owner or Outside Sources provided material and/or equipment should
953 be carefully planned and enough time given that this process will not impact the project schedule.

954 7. The Procurement Process should be tracked within the project by two methods; the Procurement
955 Log and as a subset of the CPM Project Schedule

956 8. The Procurement Log is a detailed document that tracks every facet of the procurement process,
957 with exact dates, comments, and changes to each submitted material and/or equipment.

- 958 9. The CPM Procurement Schedule is a subset of the Project Schedule. It provides a summary of
959 grouped submittals or selected significant submittals for each material and/or equipment and
960 how approval, fabrication, and delivery may affect their installation within the project.
- 961 10. Cost loading of procurement schedule activities, if performed, should be on the Delivery activities
962 only. Preparation of submittals and administrative costs should not be normally loaded into
963 Preparation activities, unless specified by contract.
- 964 11. “Just-in-Time” delivery practices should be used in projecting early delivery dates for procurement
965 items in order to reflect a realistic cost projection and earned value during the project, as well as
966 keeping storage costs low.
967

Suggested New Definitions for RP 10S-90

968 **Priority System:** Pertaining to the Procurement Process; the creation of priorities when preparing and
969 reviewing for approval Submittals in order to concentrate on higher priority packages first before moving
970 on to the lower priority submittals. This process ensures the submittal process is moving forward in a way
971 that will not impact the project itself by late delivery of material and/or equipment due to late submittal
972 approval. The Priority System may be defined numerically, alphabetically, alphanumerically, or using
973 common terms such as “High, Medium, and Low”.

974
975 **Procurement Log:** The Procurement Log (also known as a procurement register, and similar to the
976 submittal log, or submittal register) is a detailed list of all items requiring formal submittal, approval,
977 fabrication, and delivery to the project site. Each action within the process is recorded establishing the
978 date each phase of the procurement process starts and finishes.
979

980 **Procurement Schedule:** The procurement schedule is a subset of the CPM Project Schedule that tracks
981 the Procurement Process through the submittal process, fabrication, and delivery to the project site. The
982 level of detail of this schedule is less than what is recorded in the Procurement Log and submittals may
983 be grouped by Submittal Package, or selected significant items, unless specific tracking is required. Each
984 line item should be linked in a path from preparation, approval, fabrication, delivery, and then to the
985 schedule activity that actually installs the material and/or equipment within the project. Such schedule
986 activities help ensure that the procurement process is moving forward and the delivery of material and/or
987 equipment does not delay the project.
988

989
990 **Submittal:** A submittal (or Vendor Data) is a contractually-required document and/or sample that must
991 be supplied to the Owner’s representative for review. It contains detailed information designed to help
992 ensure that the proposed material and/or equipment meet the requirements of the contract documents.
993 The submittal may be in the form of Product Data, Shop Drawings, Samples, Certifications, Warrantees,
994 or other requirements pertaining to the specified material and/or equipment will be installed in
995 accordance with the requirements of the contract documents.
996

March 31, 2015

997 **Submittal Log:** A detailed list of submittals sometimes grouped by specification section recording
998 significant information such as dates when submitted to owner, returned, and when approval is obtained
999 or required actions needed to obtain approval.

1000
1001 **Submittal Package:** A group of submittals required by a single specification section within the submittal
1002 log. Each package would include all of the submittals required within each specification section (i.e. Mix
1003 Design, Product Data, Shop Drawings, Certifications, Warrantees, etc.).

1004
1005 **Submittal Process:** The process where the contracted party provides detailed information to the Owner
1006 or their representative (i.e. architect, engineer, construction manager, or designer) as to required material
1007 and/or equipment to be installed as part of a project.

1008
1009 **Submittal Status:** A line item within the Coordination Meeting Agenda that reports the status and issues
1010 of any particular Submittal from preparation to delivery.
